ABSTRACT

Secret Paradise Resort, nestled in the beautiful Tacalan, Sab-ahan, Bais City, Negros Oriental, has upgraded its booking system to a user-friendly online platform. This new system, built with technologies like Bootstrap, CSS, and GCash, allows guests to easily see available cottages, pay securely online, and get instant confirmation. The resort staff also benefits from streamlined management tools, making it easier to handle bookings, process payments, and generate reports. The project has modernized the resort's booking process, making it easier for guests to relax and enjoy their vacation, while also increasing efficiency for the resort's staff.

DEDICATION

We wholeheartedly dedicate this capstone project to our families, whose unconditional support and encouragement have been our source of strength throughout this journey. To our friends, who inspired and motivated us to keep moving forward. To our professors and mentors, thank you for your guidance, patience, and invaluable insights that helped shape this project. To the resort's owner, thank you for giving us the opportunity to develop a system for your establishment, which became the foundation of this project. Above all, we thank God for granting us the wisdom, perseverance, and courage to overcome every challenge. This accomplishment is a reflection of all the love and support we have received.

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to the following individuals who played crucial roles in the completion of this capstone project:

Dr. Noel Marjon E. Yasi, University President, for his unwavering encouragement and support in helping us meet all project requirements and acquire valuable knowledge and skills.

Dr. Ma Sarah Fatima P. Valencia, OIC-Campus Administrator, for her consistent encouragement and belief in our abilities.

Dr. Zenaida D. Calumpang, Dean of the College of Arts and Sciences, for her invaluable advice and unwavering motivation throughout the project.

Mr. Jetty A. Casido, Capstone Advisor, for his exceptional guidance, support, and expertise, which were instrumental to our success.

Mr. Julius Badoy, Mrs. Archel Liman, and **Mr. John Rey Estrosas,** our panelists, for their insightful feedback and valuable contributions that significantly enhanced our project.

Ms. Jessa Mae B. Romeral, for checking and editing this academic paper.

To our **Family**, **Relatives,** and **Friends,** for their unwavering spiritual, moral, and financial support.

Above all, to my **Heavenly Father,** for the infinite love, grace, and mercy that guided me throughout this journey. Your unwavering presence provided the strength, wisdom, and guidance I needed to overcome challenges and achieve this remarkable milestone. I am eternally grateful for your blessings.

Thank you very much.

CHAPTER 1

INTRODUCTION

Project context

The tourism industry is fast-paced and competitive, and customer satisfaction is key to a resort's success. For Secret Paradise Resort, located in Sitio Tacalan, Brgy. Sab-ahan, Bais City, Negros Oriental, providing an exceptional guest experience starts with a smooth and efficient reservation process. With more travelers turning to online platforms to plan their trips, having a reliable and easy-to-use reservation system is essential for attracting and keeping guests. A seamless reservation experience encourages repeat visits and helps the resort stand out in a crowded market.

However, despite technological advances, many resorts still struggle with outdated reservation systems, leading to errors, double reservation, and frustrated customers. This is especially challenging for Secret Paradise Resort, which is tucked away in a remote location, making it harder to be discovered by potential guests. In this situation, a modern, welldesigned reservation system can make all the difference. A smooth, hassle-free reservation process can help improve visibility, increase accessibility, and create a positive first impression for guests who might otherwise overlook the resort.

This project seeks to identify the specific issues Secret Paradise Resort faces with its current reservation process and find innovative solutions to improve it. The goal is to develop a user-friendly system that not only streamlines operations but also enhances the guest experience. By addressing issues such as reservation errors and simplifying the reservation process, the project will provide the resort’s management with valuable insights that will lead to higher guest satisfaction, more reservation, and a stronger competitive position in the tourism market.

Purpose and Description

The primary goal of this project is to design and implement a modern, user-friendly online reservation and reservation system for Secret Paradise Resort. The system aims to streamline the resort's reservation process by providing a smooth, efficient, and hassle-free experience for guests, while resolving the limitations and inefficiencies of the resort's existing manual system. By eliminating issues such as double reservation, errors, and operational inefficiencies, the project will significantly improve customer satisfaction and enhance the resort’s visibility to potential visitors.

The reservation system will allow guests to easily view room availability, make reservations, manage reservation, and receive instant confirmations through an intuitive interface. Key features such as real-time availability tracking, automated notifications, and secure payment options will ensure a seamless reservation experience. For resort management, the system will automate critical tasks like room allocation, reservation tracking, and payment management, increasing operational efficiency. It will also provide reporting tools and guest data management features, helping the resort monitor reservation and improve overall service. Accessible across multiple devices, the platform will allow guests to book anytime, from anywhere.

This project offers significant benefits for Secret Paradise Resort by streamlining the booking process, eliminating errors, and ensuring smooth reservations. This leads to better guest experiences, higher satisfaction, and improved reviews. Additionally, the system will increase the resort's visibility, making it easier for guests to find and reserve their stay, particularly given its remote location. The new system improves operational efficiency by automating key tasks like cottage allocation and payment management, reducing the risk of human error. It also enhances guest services through better data management and targeted marketing efforts. With scalability, the system can grow with the resort, supporting long-term sustainability.

In conclusion, this innovative reservation system addresses the resort's challenges, improves both guest experiences and internal operations, and positions Secret Paradise Resort as a tech-savvy, competitive destination in the tourism market. This project will upgrade Secret Paradise Resort's reservation process, improving guest experience, increasing reservations, and positioning the resort more competitively in the tourism industry.

Objectives of the Study

General Objective

To develop a user-friendly online reservation system for Secret Paradise Resort that simplifies the booking process, improves guest experience, and supports the resort's operations.

Specific Objectives

1. Develop an efficient online reservation system that allows guests to easily check cottage availability and make bookings.
2. Enable secure online payments so guests can safely pay reservation fees and receive receipts instantly.
3. Provide real-time reservation status updates so guests can track their booking anytime.
4. Enhance accessibility of resort information by displaying details about cottages, services, and amenities on the website.
5. Incorporate a customer feedback feature to allow guests to share their experiences and suggestions for improvement.
6. Automate the scheduling system to avoid double bookings and reduce manual errors.
7. Define clear booking and payment policies, such as the one-year booking limit and nonrefundable down payment.
8. Ensure the system is reliable and always available, allowing access across different devices (phones, tablets, computers) if there's an internet connection.
9. Improve management efficiency by helping staff handle reservations, payments, and guest data more effectively.

10. Boost online visibility of the resort, especially because of its remote location, to attract more potential guests.

Scope and limitations

Scope

This project focuses on the development of an online reservation system for Secret Paradise Resort, designed to streamline the cottage booking process and improve the overall guest experience. Through this web-based platform, customers can conveniently select and reserve cottages online. The system supports secure digital payment methods, specifically GCash, allowing users to pay reservation fees quickly and conveniently. Upon successful payment, a system-generated receipt will be issued automatically as proof of transaction.

To promote transparency and reduce the need for manual follow-ups, customers can view the real-time status of their reservations at any time. Additionally, the website will display detailed information about available cottages, resort amenities, and services offered, enabling guests to make informed booking decisions. A built-in customer feedback feature will be available to allow guests to share their experiences and suggestions directly through the platform. This function will help the resort gather insights to further improve its services.

Limitations

Despite the system's many advantages, there are some limitations that should be noted. The system relies entirely on internet connectivity. Without access to the internet, users will be unable to log in, view resort details, or make reservations posing a potential issue in areas with weak or unstable connections.

In addition, the system only permits reservations within the current calendar year. Users cannot book dates beyond a one-year period, which may be inconvenient for those planning vacations far in advance. The reservation calendar is also fully automated, meaning all bookings are based on real-time availability. Users are unable to manually request or override unavailable dates, which may limit flexibility for guests with specific schedule preferences.

Lastly, a down payment via GCash is required to confirm a reservation. However, this payment is now refundable under certain conditions, such as cancellations made within an allowable time frame before the reserved date. This change is intended to provide more convenience for users who may need to adjust or cancel their plans. These limitations are in place to ensure the system's overall performance, security, and reliability, though they may influence the preferences and decisions of some users.

CHAPTER II
REVIEW OF RELATED LITERATURE

Related Literature

According to Generoso et al., (2019) project intitled "Resort Online Reservation: Basis for Action Plan" offers valuable insights for developing an online reservation system for Secret Paradise Resort. The research examines factors influencing the use of resort online reservation systems, such as service quality, ease of use, customer satisfaction, and the impact of online reviews. It identifies customer profiles based on age, gender, internet usage, and visit frequency, and evaluates how these factors affect the intention to use an online reservation system. The findings highlight that the majority of customers, particularly younger individuals, appreciate the convenience and usability of online booking platforms, and that the system's effectiveness significantly contributes to overall satisfaction. Similarly, Secret Paradise Resort faces challenges with its current manual reservation process, which is slow and prone to errors. By developing an online reservation system, Secret Paradise can enhance customer satisfaction, streamline bookings, and improve service quality, just as the study suggests for other resorts. The proposed solution aims to address these issues by providing a faster, more efficient booking process, thereby improving both operational efficiency and guest experience at the resort.

Based on the study of Akramul Islam (2020) the project intitled "Resort Management System" discusses the critical need for online booking systems in the hospitality sector, emphasizing that the rising demand for accommodations has led to increased guest frustrations due to limited availability. Islam argues that implementing an online booking platform can significantly enhance customer convenience, enabling guests to check availability, compare prices, and reserve rooms in advance. The case of Secret Paradise Resort highlights the challenges identified by Islam, as it struggles with an outdated reservation system that impacts both guest experience and operational efficiency. Located in the remote

Sitio Tacalan, the resort's reliance on outdated booking methods has led to errors and customer frustration. Developing a modern, user-friendly online booking platform would enhance service delivery, attract more visitors, and strengthen the resort's brand in the competitive tourism market, aligning with the principles outlined in Islam's research.

The study of Wang et al. (2020) intitled "Explore travel motivations among independent travelers within the niche hotel market" focusing on the hybrid cultural influences on Chinese tourists. Using an ethnographic methodology, the authors analyzed 659 online reviews from 12 niche hotels across six travel websites. Their findings reveal a range of motivations for hotel selection, including attractive environments, quality, uniqueness, and cultural offerings, categorized into modern Chinese, traditional Chinese, and foreign culture-oriented motivations. The study highlights the significance of understanding these motivations to cater to the characteristics of the Chinese independent traveler segment, suggesting that both Chinese and Western cultural factors increasingly influence their choices. This literature is particularly relevant to the project on implementing a modern reservation system in the resort industry. By understanding the motivations identified by Wang et al., resorts can develop userfriendly booking systems that enhance the guest experience.

The study by Desak Koming Sundari, Ni Nyoman Triyuni, and I Gusti Made Wendri (2020), titled "Reservation Strategy to Increase Room Occupancy Through Online Platform at Desa Visesa Ubud Resort", explores the contribution of online platforms such as Agoda, Booking.com, Expedia, Tiket.com, and Waka, which accounted for over 50% of room reservations from 2017 to 2019. Utilizing data from interviews, observations, and literature reviews, the study emphasizes the importance of effective reservation strategies and strong interpersonal skills among staff to optimize the use of these platforms. It recommends regular evaluations of platform performance and additional marketing efforts to further enhance room reservations. These insights are relevant to Secret Paradise Resort in Sitio Tacalan, Brgy. Sabahan, Bais City, which struggles with an outdated reservation system. By integrating modern online platforms and adopting effective reservation strategies, Secret Paradise Resort

can streamline operations, increase customer satisfaction, and enhance its competitiveness in the tourism market.

RELATED STUDIES

From the study of, Saito et al. (2019) explore the "Application of online booking data to enhance hotel revenue management". The paper emphasizes the necessity of developing a quantitative revenue management method that incorporates overbooking strategies, particularly due to the rising prevalence of online bookings and last-minute cancellations that can negatively impact hotel operations. The authors propose a quantitative overbooking model tailored for online booking systems, which integrates insights derived from customers' choice behaviors using discrete choice modeling. By combining this model with actual online booking data from luxury hotels in Tokyo, they demonstrate how hotels can optimize their room pricing and overbooking levels to maximize expected sales. The insights are particularly relevant to the development of the Secret Paradise Resort Reservation System. Given that Secret Paradise faces challenges related to outdated booking methods, adopting a sophisticated revenue management approach like the one outlined in Saito et al.'s study could significantly enhance its operational efficiency and profitability. By analyzing online booking data, the resort can implement effective overbooking strategies that account for customer preferences and behaviors, reducing the risk of lost revenue due to cancellations or no-shows. This would allow Secret Paradise to set optimal room rates and maximize occupancy, ultimately leading to a more robust financial performance.

The research conducted by Generoso et al. (2019) focused on assessing resorts that offer "Online reservation systems, examining the factors influencing customer's intentions to use these systems". The study aimed to profile customers based on age, gender, visit frequency, educational attainment, and internet usage while evaluating the online reservation systems in terms of service quality, usefulness, ease of use, online reviews, customer experience, and satisfaction. Surveying 305 customers revealed that most respondents were

aged 18-29, predominantly male, and had visited the resort multiple times. This study is directly relevant to the development of the Secret Paradise Resort Reservation System, as it underscores the importance of understanding customer demographics and preferences. By incorporating insights from Generoso et al. (2019), the project can focus on enhancing user experience and satisfaction, addressing factors that influence the intention to use the online reservation system.

The study by Sudarsono et al. (2020) intitled "Examines the use of Extreme Programming (XP) methodology in developing hotel reservation systems". The authors argue that traditional software development approaches often fail to meet the fast-changing requirements of the hospitality industry. XP emphasizes iterative development, continuous feedback, and close collaboration with end users, allowing for a more adaptive and user-centric approach to system development. The findings reveal that using XP results in higher quality software, improved customer satisfaction, and systems that align closely with the needs of both hotel operators and their guests. Extreme Programming (XP) for hotel reservation systems is highly relevant to Secret Paradise Resort. XP focuses on iterative development, continuous feedback, and close collaboration with end users, which can help create a more adaptable and user-friendly reservation system. By adopting XP, Secret Paradise Resort can develop a system that aligns closely with both staff and guest needs, improving software quality and customer satisfaction. This approach would also allow for quick adjustments, ensuring the system meets the resort's evolving requirements and reduces errors in the current manual process.

The study of Miller, M. C. (2023). Entitled "Perception of Experiential Value in Luxury Hotel Settings: The Case of Experiential Programming and Impact on Consumers". Stated that the shift in luxury definitions from traditional materialism to contemporary, immersive experiences. It highlights how luxury hotels leverage experiential marketing to enhance guest satisfaction through various programs, such as surfing lessons and cactus garden tours, often provided as complimentary amenities by hotel staff. This research is particularly relevant to

the development of the Secret Paradise Resort reservation system. By understanding the experiential values outlined by Miller, the resort can design a booking platform that highlights unique local experiences and facilitates easy access to experiential activities.

THEORETICAL FRAMEWORK

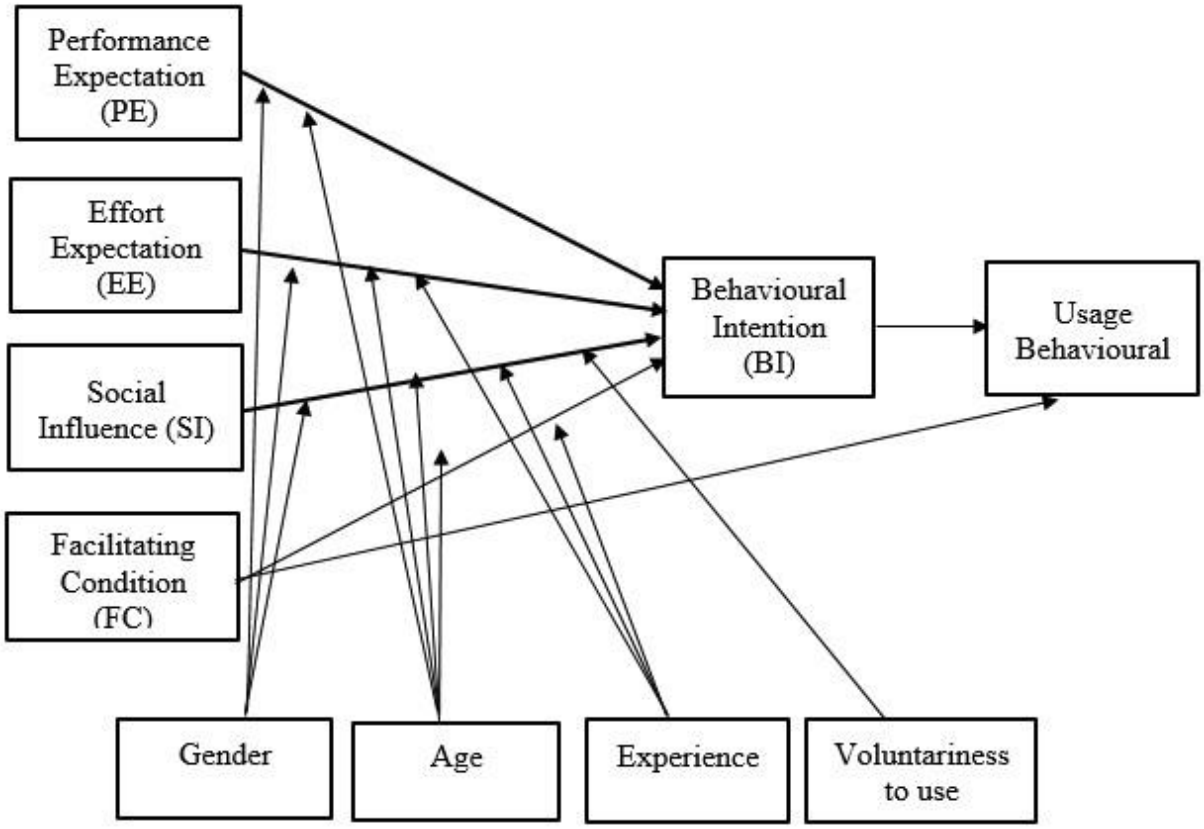

Figure 1. UTAUT Model

The Unified Theory of Acceptance and Use of Technology (UTAUT) model was published in 2003 by Venkatesh, Morris, Davis, and Davis. The UTAUT model is a framework for understanding how people accept technology. It's based on eight other models, including the Technology Acceptance Model (TAM), the Theory of Planned Behavior (TPB), and the Innovation Diffusion Theory (IDT). The UTAUT model is often used to study how people adopt information systems and the challenges they face. It's particularly common in higher education research.

The UTAUT model is useful for studying Secret Paradise Resort's reservation system because it offers insights into why users accept or reject technology, focusing on factors like

ease of use, perceived benefits, and social influence. By applying this model, the resort can create a booking system that's intuitive and meets customer needs, reducing errors and enhancing the guest experience. In the competitive tourism industry, a seamless reservation process gives Secret Paradise an edge, increasing visibility and customer satisfaction, which are critical for attracting and retaining guests.

Conceptual Framework

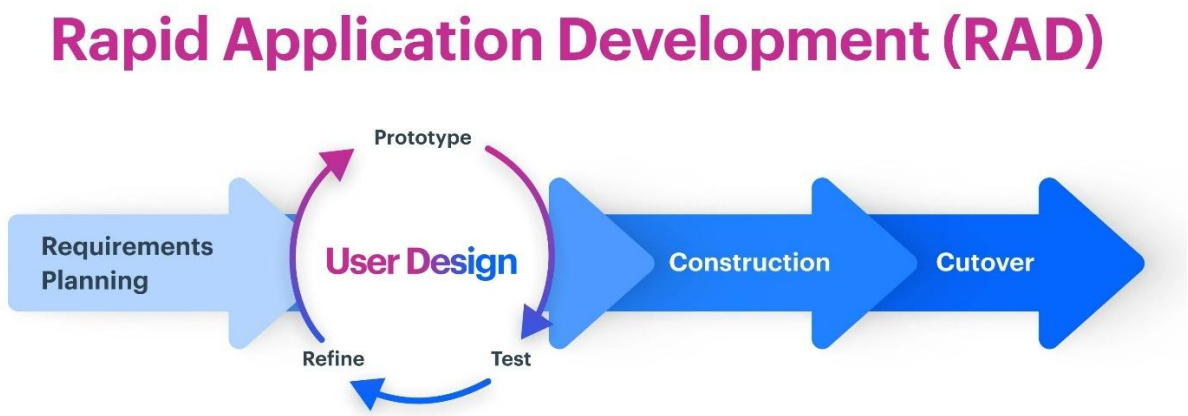

Figure 2. Rapid Application Development

The Rapid Application Development (RAD) model offers a powerful approach to software development, focusing on speed, flexibility, and stakeholder involvement. By enabling quick iterations and the use of reusable components, RAD ensures the fast delivery of functional prototypes, enhancing user satisfaction and project adaptability. However, its reliance on highly skilled developers, modular design, and automated tools presents challenges, particularly for projects with complex requirements or limited resources.

The RAD model can help Secret Paradise Resort quickly develop a new reservation system by focusing on speed, flexibility, and stakeholder involvement. By building and testing a prototype with feedback from staff and guests, the system can be improved rapidly. This approach allows for faster development, addressing issues like reservation errors, and enhancing the customer experience. RAD ensures the system stays adaptable, giving the resort a competitive edge in the tourism market.

The Rapid Application Development (RAD) model ensures a fast and efficient approach to building the Secret Paradise Resort Reservation System by following four key phases. First, in Requirements Planning, we gather input from resort staff and customers to identify issues like double bookings and inefficiencies. Next, in User Design, we create a prototype, test it, and refine it based on feedback to ensure a smooth booking experience. Then, in the Construction phase, we fully develop the system with essential features like real-time availability, payment integration, and security measures. Finally, in the Cutover phase, we launch the system, provide support, and make improvements based on user feedback. This approach ensures a user-friendly, efficient, and reliable reservation system that enhances guest satisfaction and boosts the resort's success.

CHAPTER III

TECHNICAL BACKGROUND AND METHODOLOGY OF THE SYSTEM

This section provides an overview of the processes and techniques used in the development of the Secret Paradise Resort Online Reservation System. It discusses the data gathering procedure, system design, schedule feasibility, and cost-benefit analysis. It also presents the system's Data Flow Diagram (DFD), Context Flow Diagram, Top-Level Diagram, and Use Case Diagram to illustrate system functions and processes. Additionally, this section outlines the hardware and software requirements, as well as the interface design, ensuring a comprehensive approach to system development and implementation.

Data Gathering Procedure

To develop a system that effectively addresses the operational needs of Secret Paradise Resort, the proponents began the study by conducting an on-site visit to the resort, located in Sitio Tacalan, Barangay Sab-ahan, Bais City, Negros Oriental, approximately 35 kilometers from the city proper. During this visit, an in-depth interview was carried out with the resort owner to gain comprehensive insights into the existing manual processes for booking and guest management. This initial engagement allowed the proponents to observe the current workflow, identify operational challenges, and gather essential information that served as the foundation for proposing a digital solution tailored to the resort's specific needs.

The data gathering focused on how reservations were traditionally handled such as logging bookings using notebooks, calling, or texting through mobile phones for inquiries, manually updating availability, and issuing handwritten receipts. Through this manual system, the resort often encountered issues like overbooking, delayed responses to customer inquiries, difficulty tracking payments, miscommunication, and a lack of organized records. These problems were consistently highlighted during the conversation with the owner.

While documenting these concerns, the proponents listened attentively to the resort's specific challenges and operational routines. In response, they proposed the development of a web-based reservation system as a modern solution. They explained how the shift from a manual to a computerized approach could streamline operations and improve efficiency. The discussion included a walkthrough of the proposed features—such as real-time cottage selection, online booking confirmations, automated receipts, digital payments via GCash, and a customer feedback tool.

Furthermore, the proponents outlined both the advantages and possible limitations of adopting the new system. The benefits included time-saving processes, improved accuracy in records, and enhanced convenience for both staff and guests. Limitations, such as internet dependency and non-refundable payments, were also discussed transparently to help the resort make an informed decision.

The insights gathered from this fieldwork became the foundation for designing a system tailored to address the resort's specific concerns, aiming to replace its inefficient manual procedures with a more reliable and user-friendly digital solution.

System Design

The online reservation system for Secret Paradise Resort is designed to provide guests with a hassle-free booking experience while optimizing the resort's internal management processes. Guests can access the website without the need for registration or logging in. They can directly search for available cottages by entering their preferred check-in and check-out dates. The system, developed using Bootstrap, CSS, and JavaScript, will display a list of available cottages along with key details such as pricing, cottage types, amenities, and any special offers. Guests can easily browse the options and select the cottage that best suits their preferences.

Once a cottage is selected, guests will proceed to a secure payment process, integrated with GCash, to complete their booking. After the payment is successfully processed, the system will automatically confirm the reservation and send a confirmation email to the guest, along with a system-generated digital receipt for their records.

For the resort's administration, the backend system is powered by WordPress, which efficiently handles content management, while PHP serves as the server-side scripting language and MySQL manages the database operations. This robust combination allows resort staff to monitor and manage bookings in real-time. Through the user-friendly WordPress admin panel, staff can easily track cottage availability, make updates or cancellations to reservations, and generate comprehensive reports on reservation trends, occupancy rates, and payment histories supporting informed decision-making and smooth day-to-day operations. The system is designed to efficiently handle large volumes of data, ensuring that cottage availability is always updated instantly to prevent overbooking or errors. Security measures, including encrypted transactions, password protection, and user authentication processes, are implemented to protect guest information. Regular data backups are also performed to safeguard sensitive details.

By integrating these technologies, the reservation system enhances the guest experience by offering a simple, user-friendly booking process and streamlining administrative tasks. It ensures operational efficiency, data security, and scalability, allowing the system to adapt to future growth and ongoing demand.

Schedule Feasibility

The researchers used a Gantt Chart to plan and track the project efficiently. It outlined key tasks like title creation, defense, revisions, and system development, ensuring each phase stayed on schedule. This structured approach helped monitor progress, manage deadlines, and maintain an organized workflow, leading to the project's successful completion.

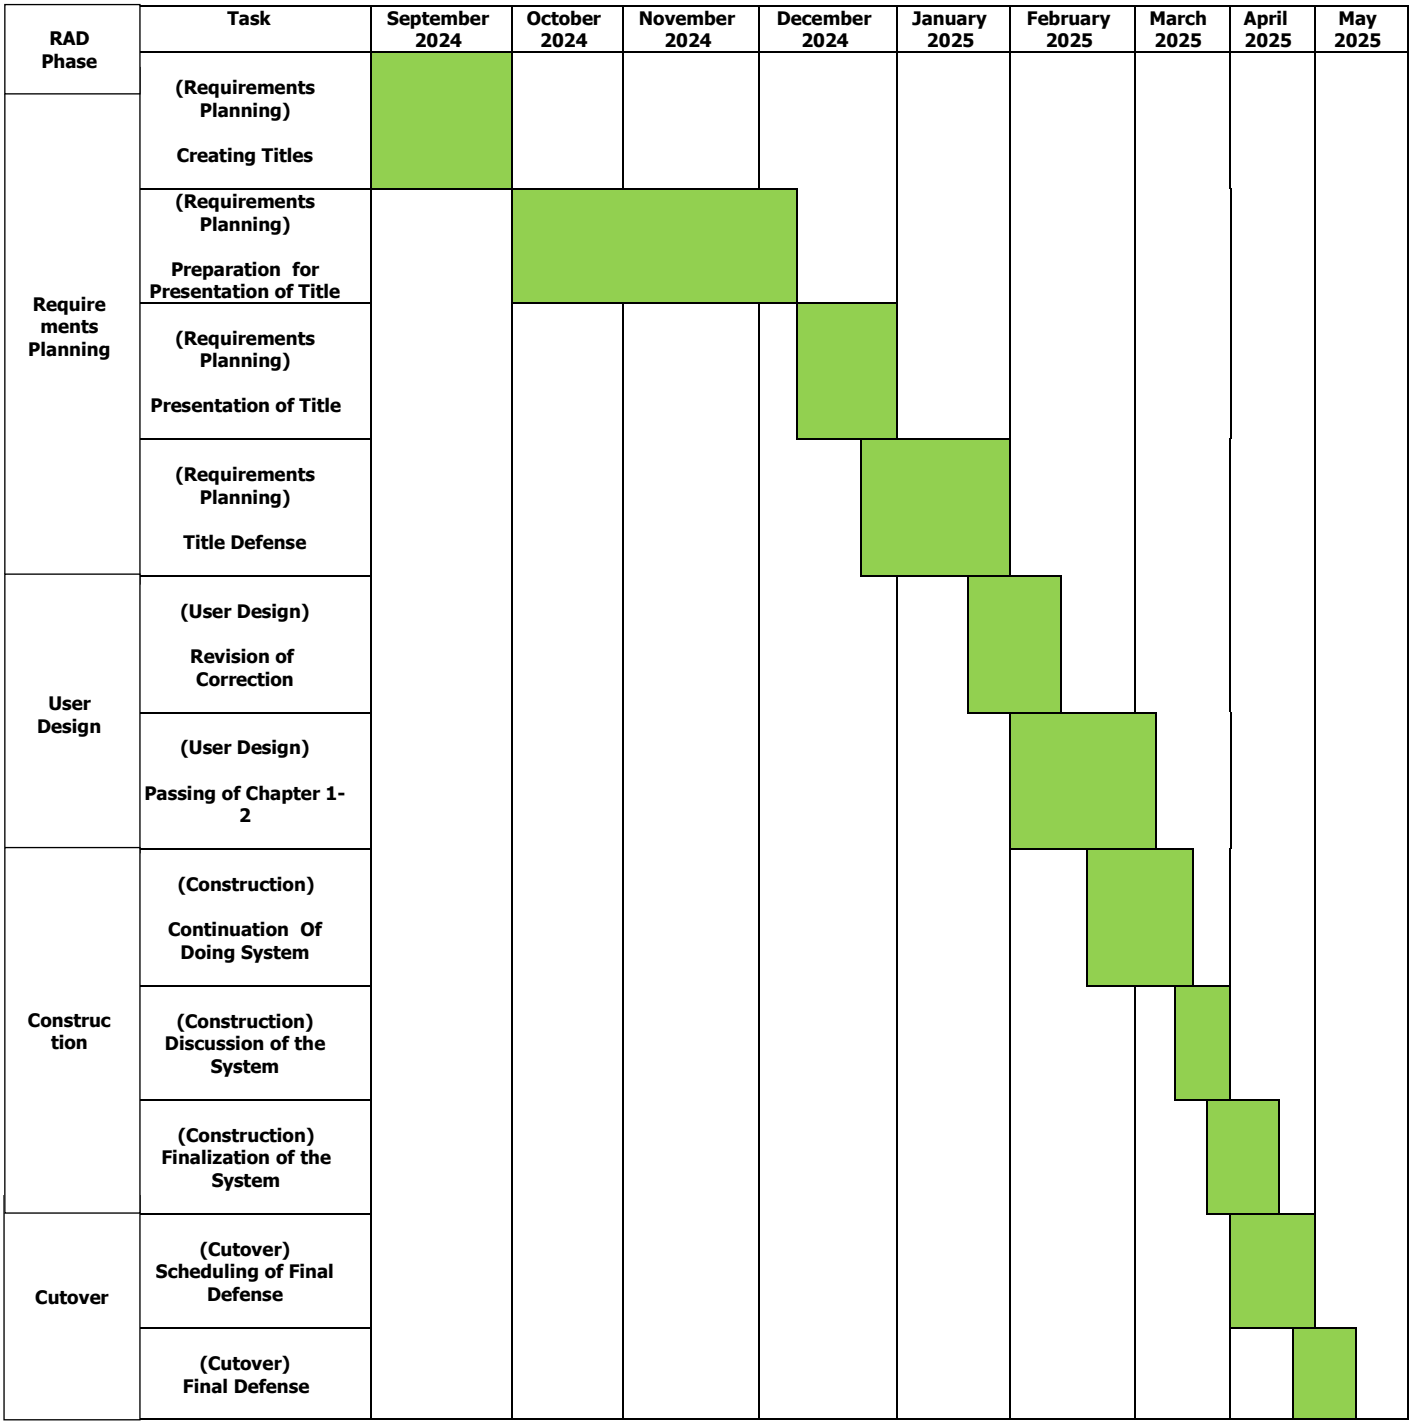

Table 1. Gantt Chart

The Gantt chart presented above illustrates the anticipated timeline for a project extending from September 2024 to April 2025. The schedule begins in September 2024 with the "Creating Titles" phase, followed by a more extensive "Preparation for Presentation of Title" throughout October and November 2024, which culminates in the "Presentation of Title" in December 2024. The "Title Defense" is then scheduled for January 2025, leading to a "Revision of Correction" in February 2025, occurring at the same time as the "Passing of Chapter 1-2." The "Continuation of Doing System," representing the development phase, spans from February into March 2025, succeeded by the "Discussion of the System" and the "Finalization of the System," both taking place in March 2025. The "Scheduling of Final Defense" also occurs in March 2025, with the project concluding with the "Final Defense" in April 2025. This visual depiction outlines the ordered progression of project tasks and their estimated durations, offering a structure for project management and the monitoring of significant milestones throughout its implementation.

Economic Feasibility

HARWARE	PRICE
Laptop/Desktop	34,380.00
Wi-fi router & access point	4,500.00
Android Phones	6,000.00
Total	39,880.00

BENEFITS
1. Boosts efficiency in management and guest services.
2. Improves guest experience and satisfaction.
3. Guest can reserve, check availability, and modify reservations anytime, anywhere.

Table 2. Cost and Benefits Analysis

A cost-benefit analysis assesses the financial viability of a proposed system by comparing its potential benefits with development costs. It includes anticipated expenses like software, hardware, and maintenance, alongside expected gains such as efficiency, cost savings, and revenue. This evaluation helps determine if the system is a worthwhile investment.

DATA FLOW DIAGRAM

A. Context Flow Diagram

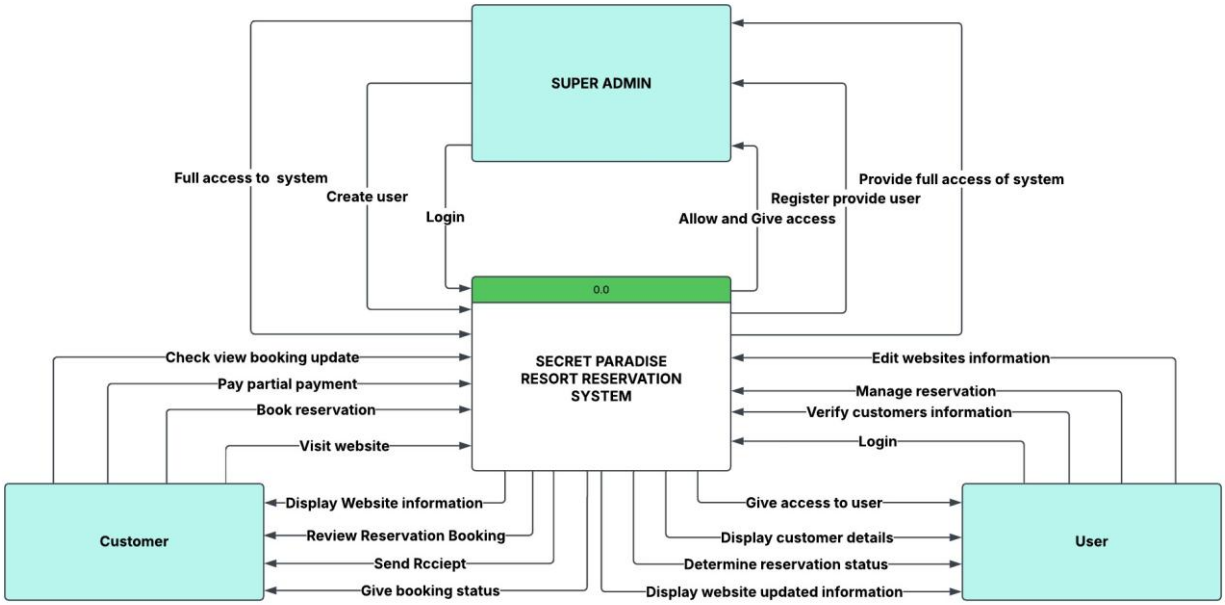

Figure 3. Context Flow Diagram

The context flow diagram outlines the interactions between the "Secret Paradise Resort Reservation System" and its external stakeholders, including customers, resort staff (users), and system administrators. The diagram serves as a high-level representation of the system's scope, illustrating how data and control commands are exchanged between these entities.

At the center of the diagram is the reservation system itself, depicted as a green rectangle, which handles all core functionalities related to bookings, payments, and website management. Customers interact with the system by visiting the resort's website, making

reservations, checking booking updates, and submitting partial payments. In return, the system provides them with booking confirmations, receipts, and real-time status updates.

On the other end, resort staff (users) access the system to verify customer details, manage reservations, and update website content. They must log in to gain authorized access, after which they can review booking statuses, modify website information, and validate customer data. The super admin holds the highest level of control, responsible for creating user accounts, assigning permissions, and overseeing system-wide operations. Upon logging in, the super admin can register new users, grant access privileges, and maintain full administrative authority over the entire system.

Overall, this diagram effectively maps the system's boundaries, clarifying how different user roles customers, staff, and administrators engage with the reservation system. By defining these interactions early in the design process, the diagram helps establish a clear foundation for further development and refinement of the system's internal workflows.

B. Top-Level Diagram

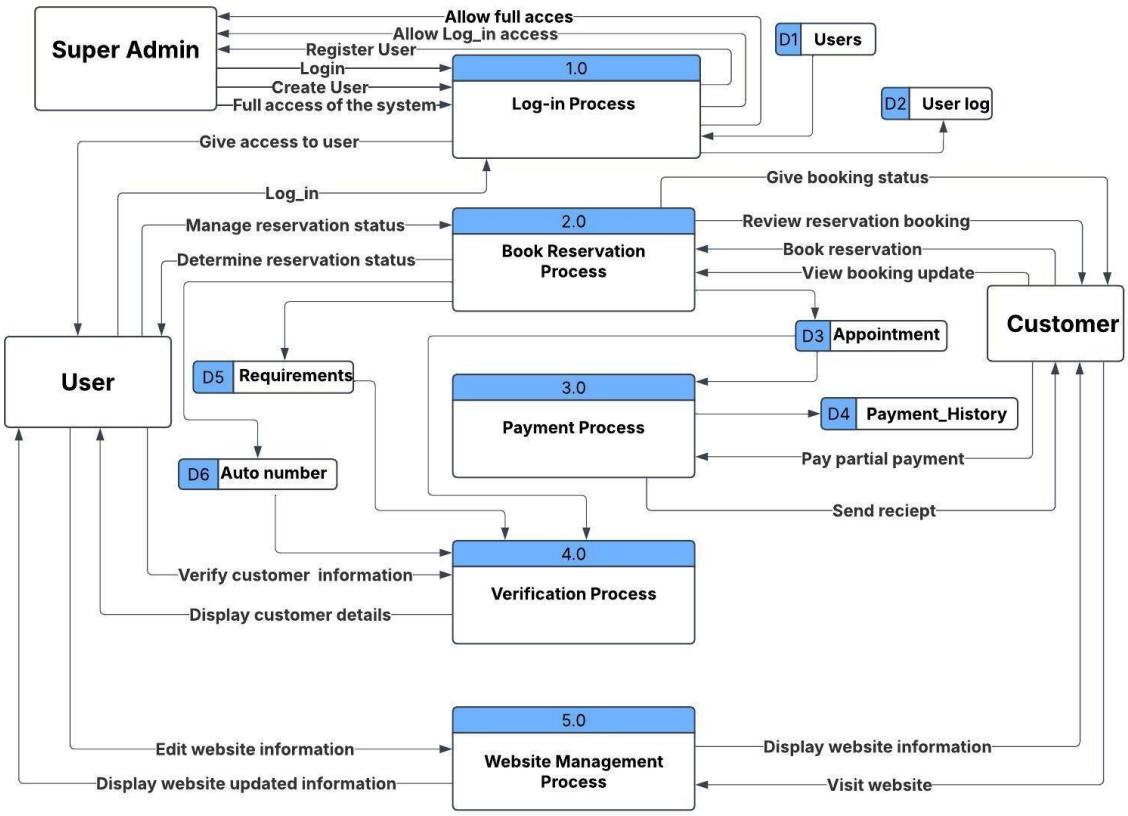

Figure 4. Top-Level Diagram

The Secret Paradise Resort Reservation System is designed as a seamless ecosystem that connects administrators, staff, and guests through carefully orchestrated processes and secure data management. At its heart lies a series of interconnected workflows that ensure smooth operations from user management to booking fulfillment.

The story begins with the Super Admin, the gatekeeper of the entire system. Using Process 1.0 (User Registration), it creates and authorizes staff accounts, carefully storing each user's credentials (D1) in an encrypted database. This foundational step sets the stage for all subsequent interactions within the system. When any authorized user attempts to access the system, Process 2.0 (Login Authentication) springs into action, verifying identities against the stored D1 credentials while generating unique session IDs (D6) to track active users.

For guests dreaming of their tropical getaway, the system offers an intuitive interface where they can browse up-to-date resort information. Behind the scenes, Process 5.0 (Website Management) maintains this digital storefront, with staff regularly updating content requirements (D5) through a user-friendly CMS. The moment a guest decides to book their stay, Process 4.0 (Verification) carefully examines their details (D3) and reservation parameters, assigning an auto-generated booking ID (D6) to create a unique reservation record.

The financial aspect comes alive through Process 3.0 (Payment Handling), which securely processes transactions (D2) and generates digital receipts (D4) for guests. Whether it's a full payment or partial deposit, each financial interaction is meticulously recorded and linked to the appropriate reservation. Staff members can then access these records through their authenticated sessions to assist guests, verify information, or update booking details.

Throughout this journey, data flows securely between specialized storage solutions. Customer profiles (D3) reside in a flexible NoSQL database, while financial records (D2) are maintained in a more structured SQL environment with robust audit capabilities. The system's architecture ensures that website content (D5) can be updated without disrupting ongoing

reservations, and that user credentials (D1) remain protected through industry-standard encryption.

From the Super Admin's oversight to the front desk staff's daily operations and the guests' booking experience, each component works in harmony. The auto-numbering system (D6) provides consistency across reservations and sessions, while the verification processes maintain data integrity at every step. What emerges is not just a collection of processes, but a thoughtfully designed digital environment that mirrors the resort's commitment to seamless hospitality where technology enhances rather than complicates the guest experience, and where staff have the tools, they need to provide exceptional service.

Entity Relationship Diagram

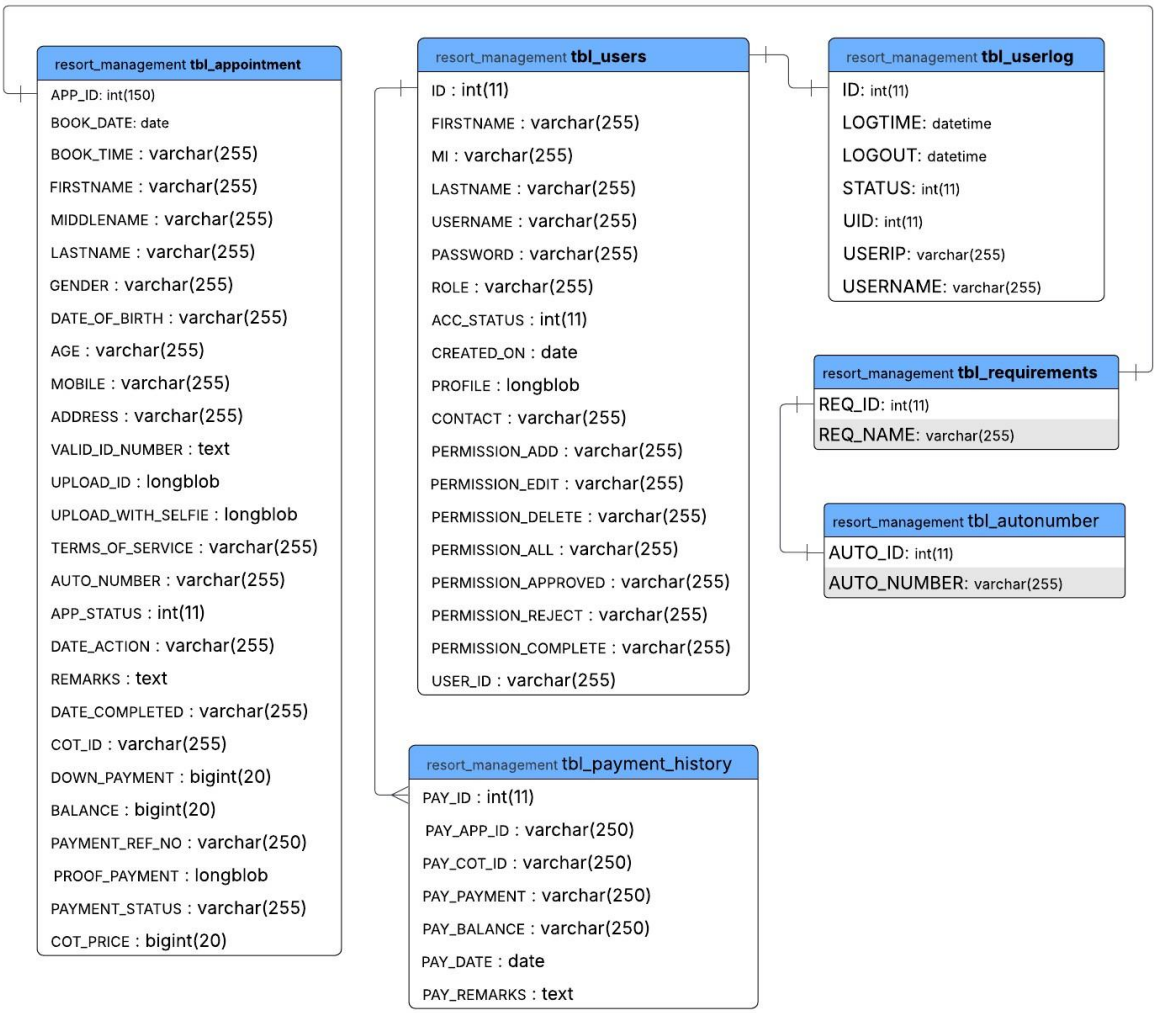

Figure 5. Entity Relationship Diagram

Entity-Relationship Diagram (ERD) for Secret Paradise Resort's management system features four core entities with clearly defined one-to-many relationships that drive resort operations. The system revolves around the Application/Booking entity (tbl applications), which contains all guest reservation details from personal information to payment records, with APP_ID serving as its primary key. Staff members are represented in the User entity (tbl users) where each employee's credentials, permissions, and profile data are stored under a unique ID. A critical one-to-many relationship exists here, where one staff member (1) can process multiple guest bookings (N), enabling efficient handling of reservations. The system maintains security through the Login Logs entity (tbl logs) which records authentication attempts, creating another one-to-many relationship as each user (1) generates multiple login records (N) over time.

Document requirements are managed through the Requirements entity (tbl requirements), which would typically participate in a many-to-many relationship with bookings through a junction table (one booking requiring multiple documents, and each document type applicable to multiple bookings). The schema also suggests potential hierarchical relationships among users through permission fields that could allow senior staff to approve or reject junior staff actions. Additional one-to-many relationships are implied throughout the system, such as between bookings and their payment records, or between users and their profile documents. These carefully structured relationships, combined with comprehensive attribute collections for each entity, create a robust framework that supports the resort's operational workflow from guest booking to staff management while maintaining strict security and audit controls.

Use Case Diagram

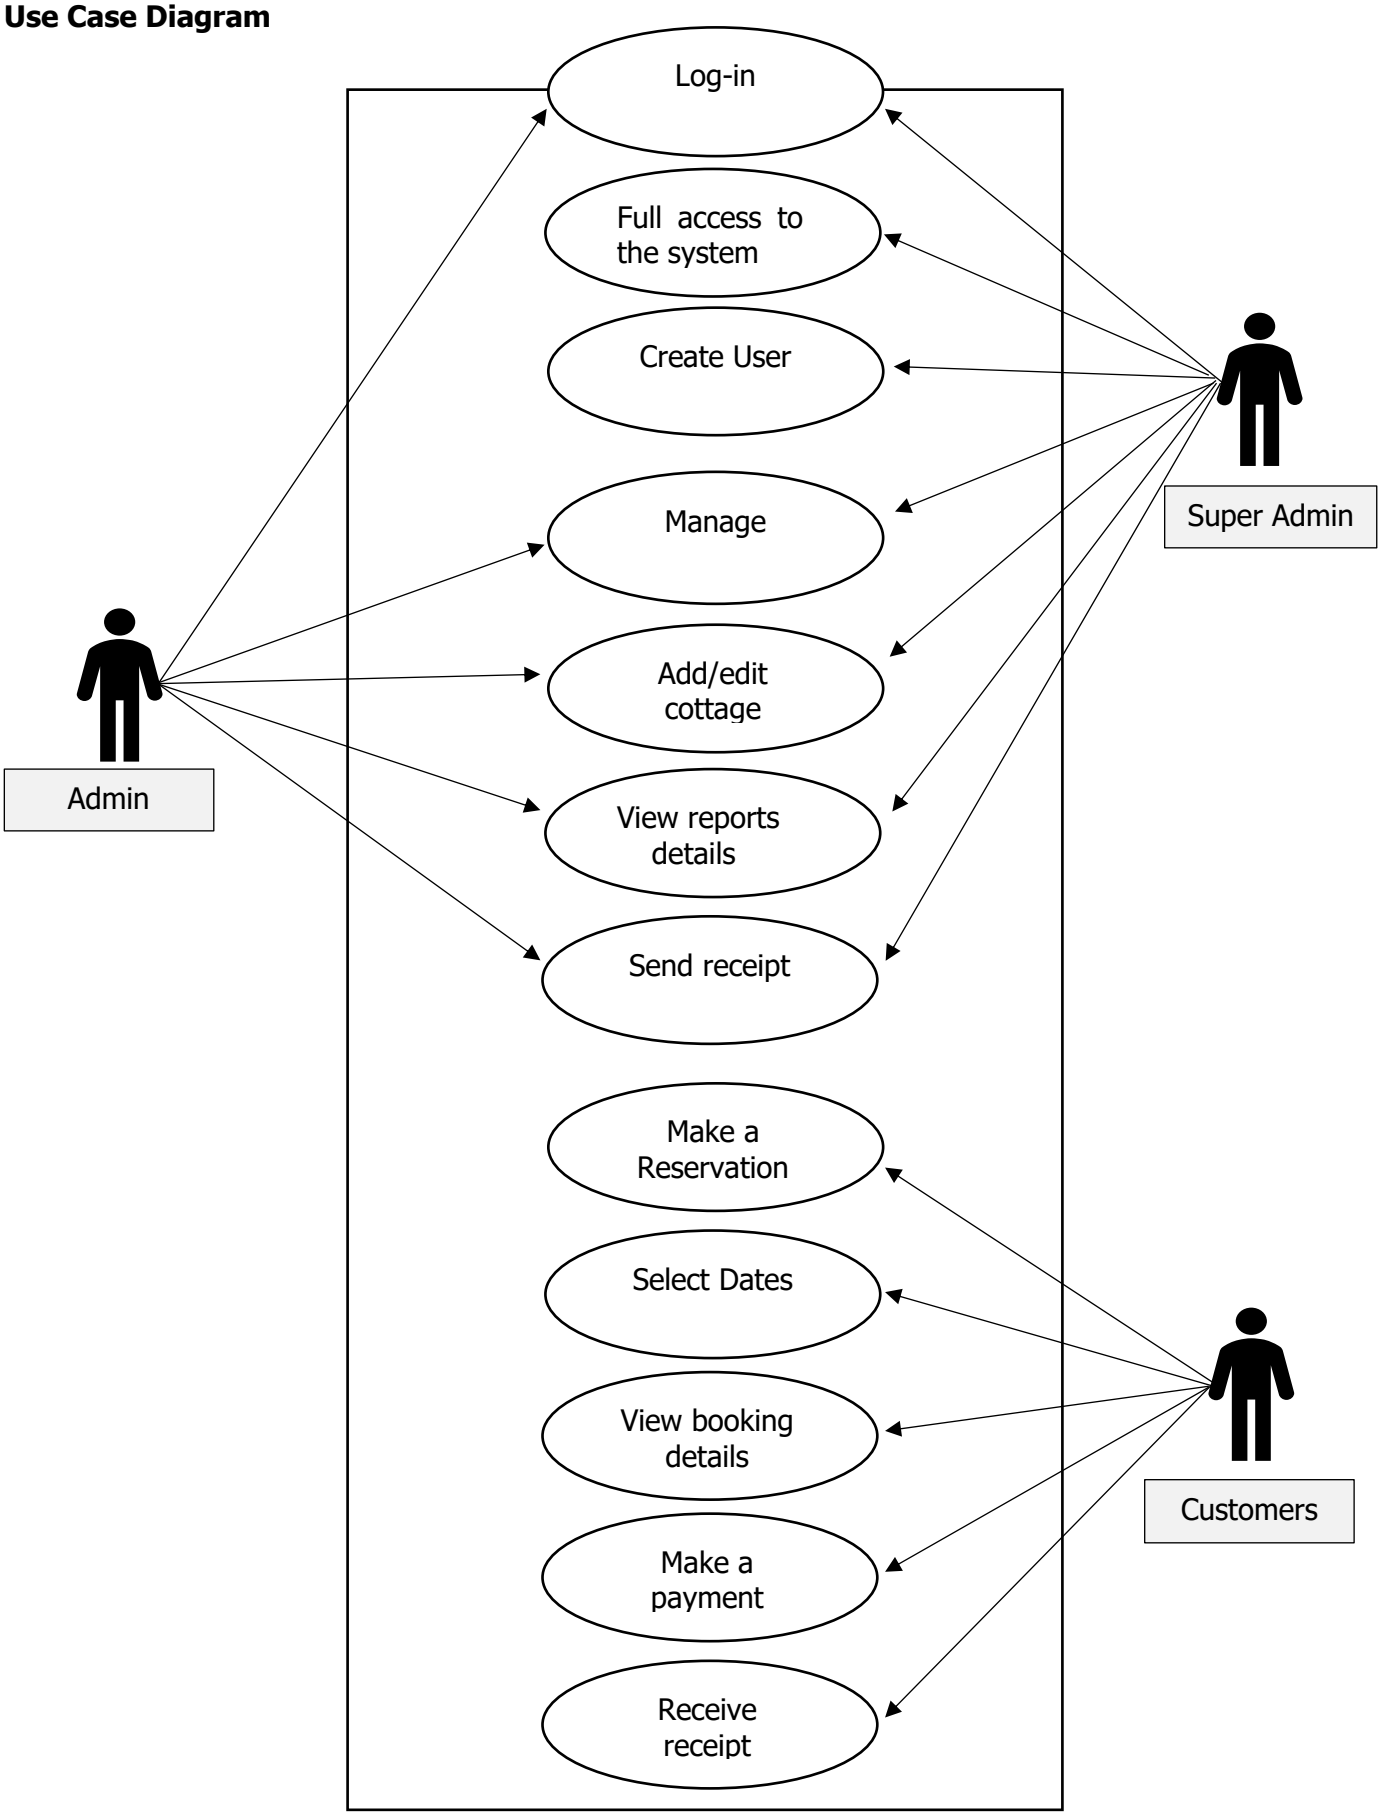

Figure 6. Use Case Diagram

The Use Case Diagram for the Secret Paradise Resort system illustrates the key functionalities and interactions between users and the reservation platform. At its core, the system serves two primary actors: Customers who make reservations, and the Super Admin who manages the entire system. Customers engage with straightforward booking workflows - they select dates, view cottage details, make payments, and automatically receive receipts upon completion. The Super Admin, after logging in, gains comprehensive control including user account creation, reservation management, cottage detail updates, report generation, and receipt distribution. This role-based structure ensures a clear separation of capabilities, where customers enjoy a streamlined booking experience while administrators maintain full oversight of operations. The diagram effectively maps the end-to-end journey from reservation initiation to administrative management, highlighting automated processes like receipt generation while emphasizing the system's hierarchical access controls. Importantly, it showcases how different user types interact with distinct, yet interconnected system features to facilitate efficient resort operations.

Hardware And Software Requirements

ITEM OF SOFTWARE	Description Specification
	Bootstrap a popular open-source framework for building responsive and mobile-first websites. It provides a set of ready-to-use components (like buttons, forms, and navigation bars) that help developers create a sleek and consistent layout across different devices and screen sizes.
	CSS is used to style the visual presentation of the website. It controls the layout, colors, fonts, and overall appearance. In this system, CSS is essential for creating a visually appealing and user-friendly design that enhances the guest experience when navigating the reservation platform.
	JavaScript adds interactivity to the website. It allows for dynamic features, such as form validation, interactive maps, real-time updates, and other userdriven actions.
	PHP is a server-side scripting language that powers the dynamic content of the website. It is used to handle requests from the frontend, manage user inputs, process reservations, and interact with the database.

	WordPress is a content management system (CMS) that simplifies the creation and management of websites. In this system, WordPress is used as the platform for managing the reservation system's content, user interface, and backend features.
	SQL is used to manage and query the database. It stores all the critical data, such as customer details, reservation information, and payment records.
	A unique **domain name** will be registered to provide an easy-to-access web address for the reservation system. This ensures that guests can quickly find and use the platform online.

Table 3. Software Requirement

ITEM OF HARDWARE	**Description specification**
	A **smartphone** is a mobile device that combines the functionality of a traditional mobile phone with advanced computing capabilities. It typically has a touchscreen interface, allowing users to access a wide range of applications and services, such as web browsing, email, and social-media, as well as multimedia playback and streaming.
	A **computer** is an electronic machine that collects, stores, and processes information according to user instructions, ultimately returning the results. Functionally, it's a programmable electronic device that automatically performs arithmetic and logical operations using a set of instructions. A specific example mentioned has a core i7 processor, an 18-inch display with 1050x768 resolution, 256-500 GB of SSD storage, 4 GB of RAM, and includes a keyboard and mouse.
	An **internet connection** is a system that allows devices to access the internet, enabling communication, browsing, streaming, and more. It can be wired (fiber, DSL) or wireless (Wi-Fi, mobile data, satellite). Connection speed and reliability depend on the provider and technology used.

Table 4. Hardware Requirements

User interface

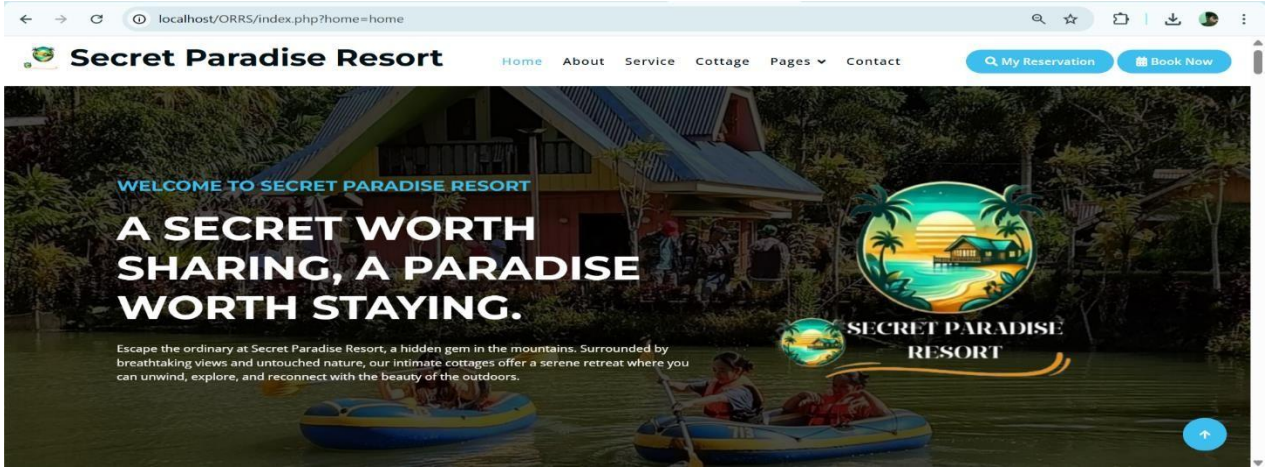

Figure 7. Home

This is the homepage of Secret Paradise Resort's online booking system, designed to give visitors a warm and inviting first impression. Right at the top, there's a navigation bar with options like Home, About, Services, Cottage, Pages, and Contact, making it easy for users to explore different sections of the site. Two key buttons stand out "My Reservation", where guests can check their existing reservation, and "Reserve Now", which lets them secure a cottage instantly. The main banner features a beautiful background image of the resort, showing cozy cottages and guests enjoying a peaceful outdoor experience.

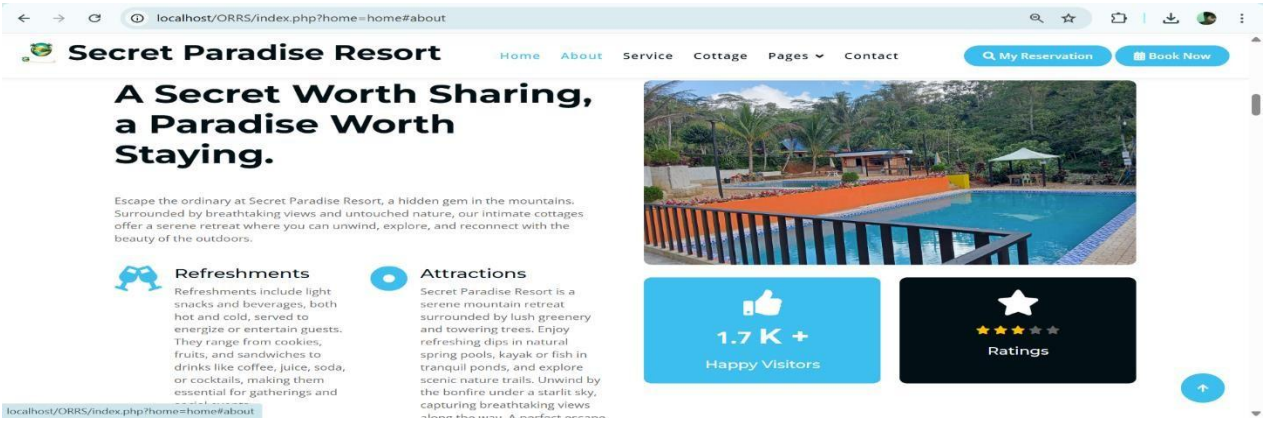

Figure 8. About us

The About Us section of Secret Paradise Resort provides an overview of what makes the resort a unique and relaxing getaway. It describes the resort as a hidden gem in the mountains, surrounded by breathtaking nature, offering a peaceful retreat where guests can

unwind and reconnect with the outdoors. The section highlights the resort's refreshments, which include a variety of snacks and drinks, and its attractions, such as natural spring pools, kayaking, fishing, scenic trails, and bonfire experiences under the stars. With an emphasis on relaxation and adventure, this section gives visitors a glimpse into the serene and refreshing experience that Secret Paradise Resort offers.

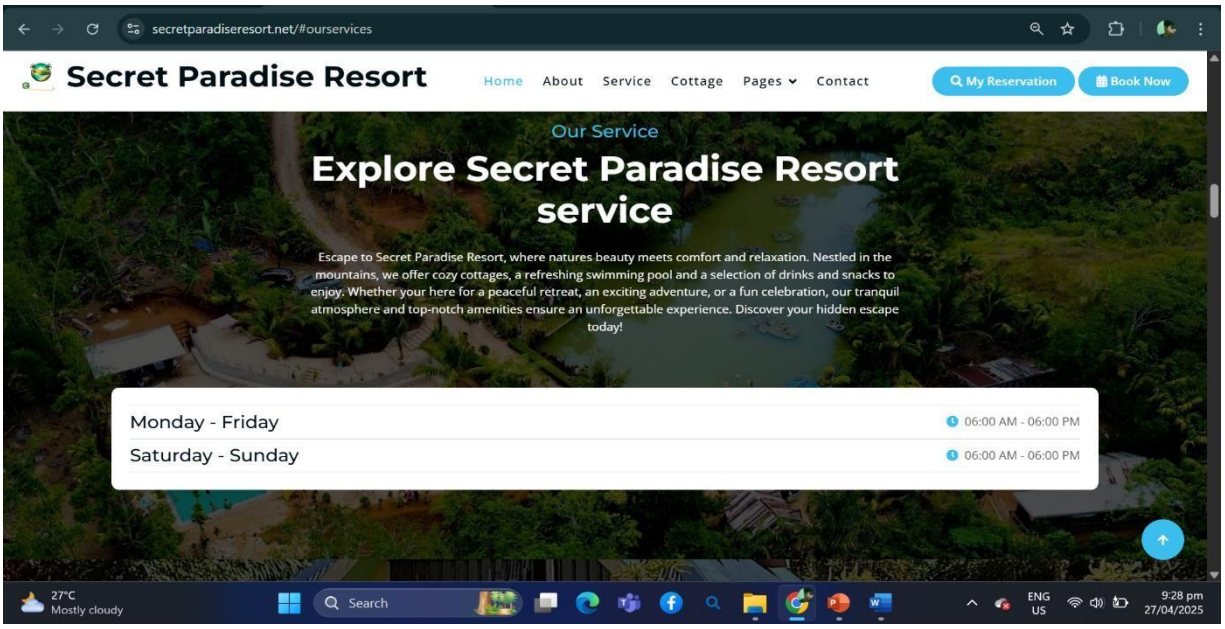

Figure 9. Services

This figure provides information about the resort's operating hours, indicating when it opens to guests. While the resort welcomes visitors during specific hours for day trips, it also offers an option for overnight stays, allowing guests to enjoy a relaxing and extended experience. This ensures that visitors can fully immerse themselves in the resort's peaceful environment, whether they come for a short visit or an overnight stay.

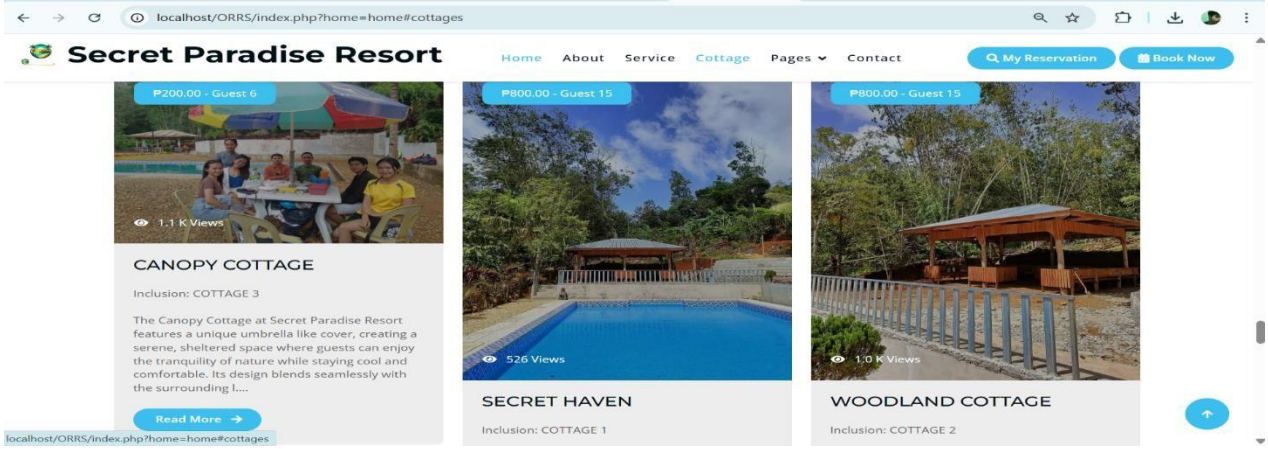

Figure 10. Cottages

This figure showcases the cottages offered by the resort, providing customers with detailed descriptions, pricing information, and a list of inclusions. It also highlights the free amenities available, helping guests make informed decisions when choosing their accommodation.

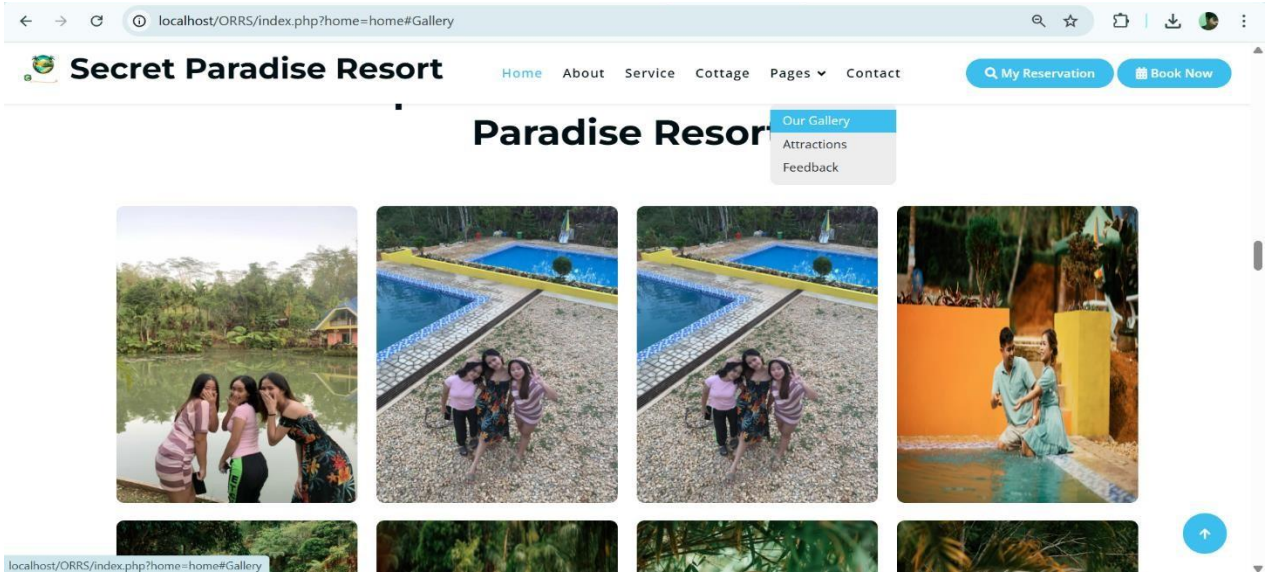

Figure 11. Gallery

This figure showcases the resort's gallery, filled with beautiful snapshots of unforgettable moments shared by families, friends, and couples. These photos capture the joy, laughter, and special memories created at the resort, where guests can relax, bond, and fully enjoy their time together.

Figure 12. Attractions

This figure highlights the Attractions section of the Secret Paradise Resort online reservation system, showcasing activities like swimming, kayaking, and fishing for both relaxation and adventure. A carousel and background image enhance visual appeal, while a navigation bar and booking buttons ensure easy access. This section promotes the resort's offerings, encouraging visitors to plan their stay.

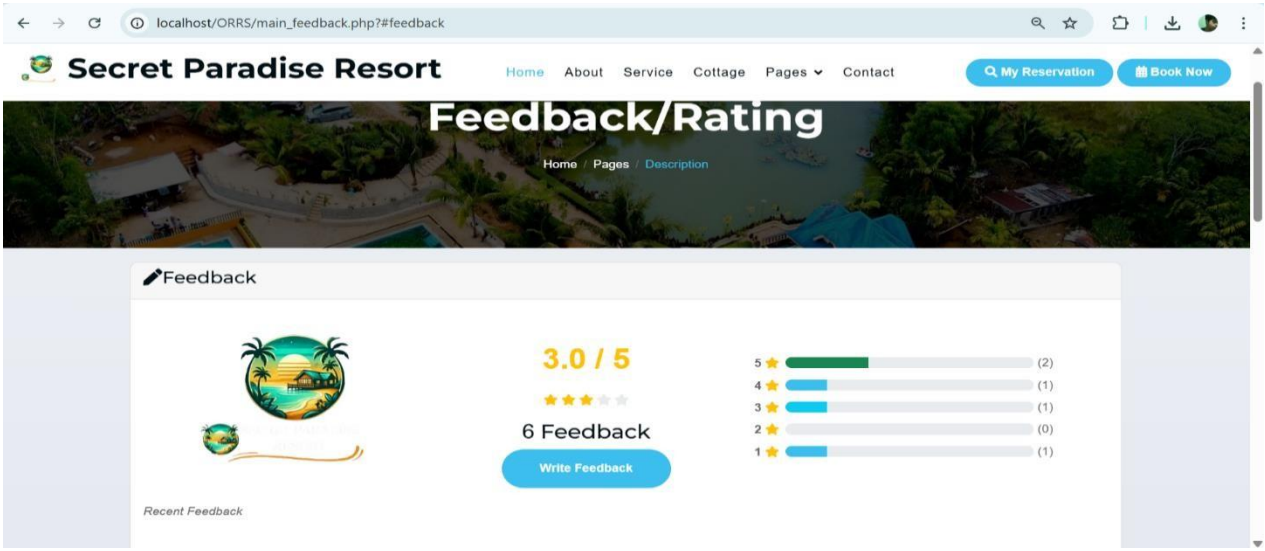

Figure 13. Feedback/Rating

This figure displays the feedback and rating system of the Secret Paradise Resort online reservation platform, showing an overall rating of 3.0/5 from 6 reviews. A bar graph visualizes the rating breakdown, with most users giving 3 to 5 stars and a few 1-star reviews. The "Write

Feedback" button allows customers to submit reviews, while the navigation bar and booking buttons ensure easy access to key sections.

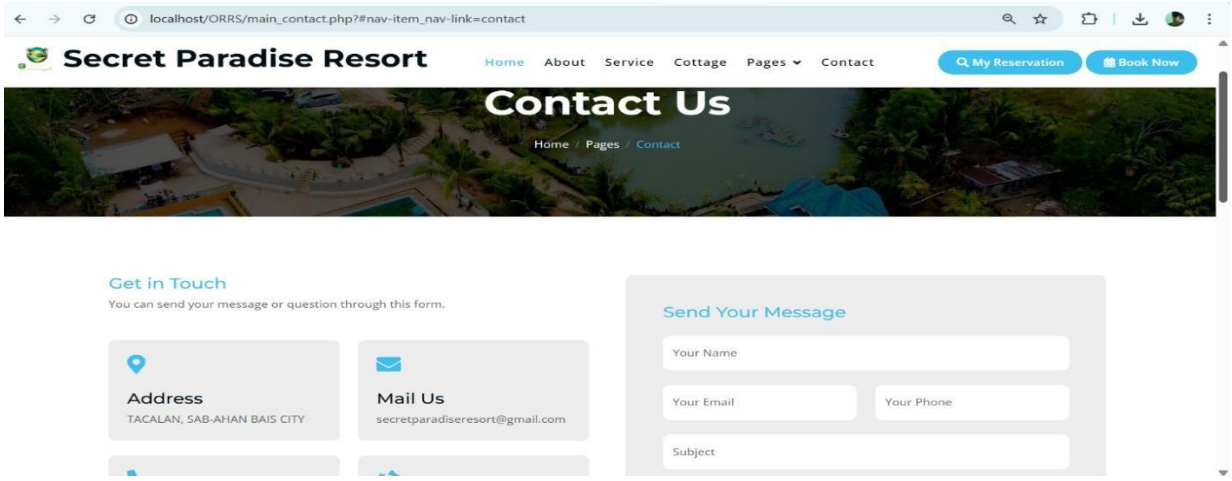

Figure 14. Contact Us

This figure displays the Contact Us page of the Secret Paradise Resort online reservation system, offering multiple ways for visitors to inquire or make reservations. It includes a "Get in Touch" section with the resort's address and email for direct communication and a "Send Your Message" form for easy inquiries. A clean design, background image, and navigation bar enhance branding and user experience.

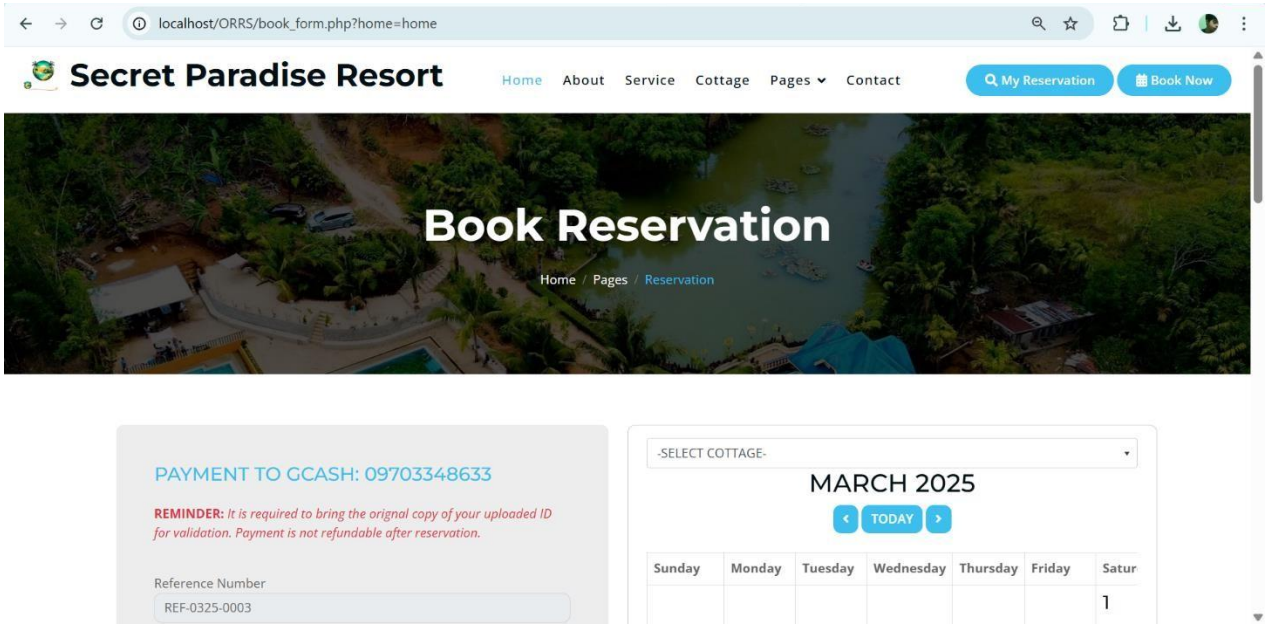

Figure 15. Book Reservation

This step shows the "Book Reservation" page for Secret Paradise Resort, where users can reserve a cottage for their visit. The page provides a Gcash payment number for booking confirmation, along with a reminder about ID validation and non-refundable payments. Users can select a cottage and pick a date from the calendar for their reservation.

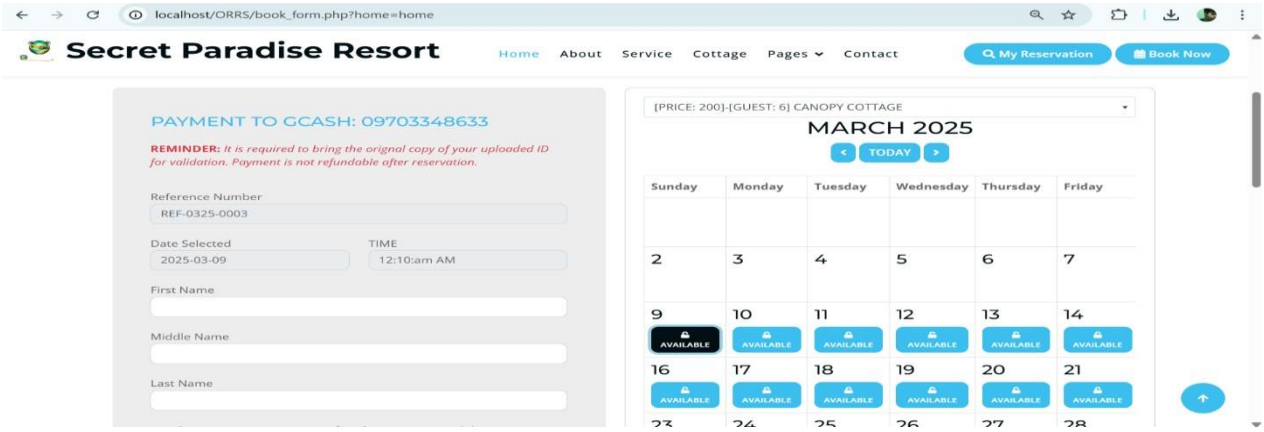

Figure 16. Cottage Selection and Reservation

This step shows the cottage selection and reservation form for Secret Paradise Resort. The user has selected a date (March 9, 2025) and a Canopy Cottage priced at 200 per guest, accommodating up to 6 guests. Available dates are highlighted in blue, while an unavailable date (March 9) is marked in black. The form requires the reference number, name, and other details to complete the reservation.

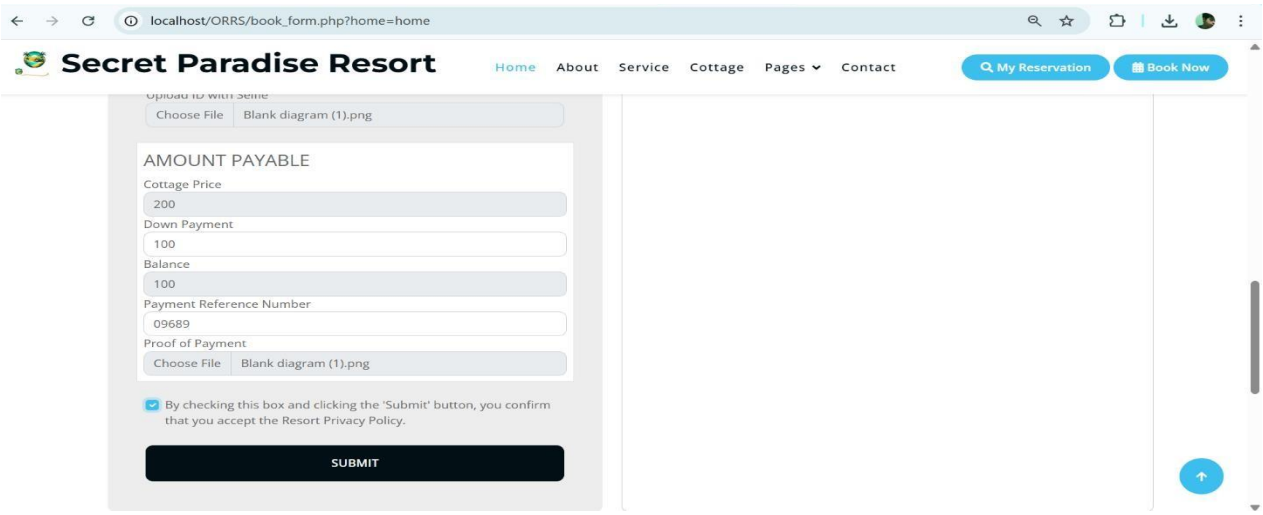

Figure 17. Payment

The image displays a Secret Paradise Resort payment form where a user is inputting payment details, including a down payment for a cottage price, a payment reference number, and proof of payment.

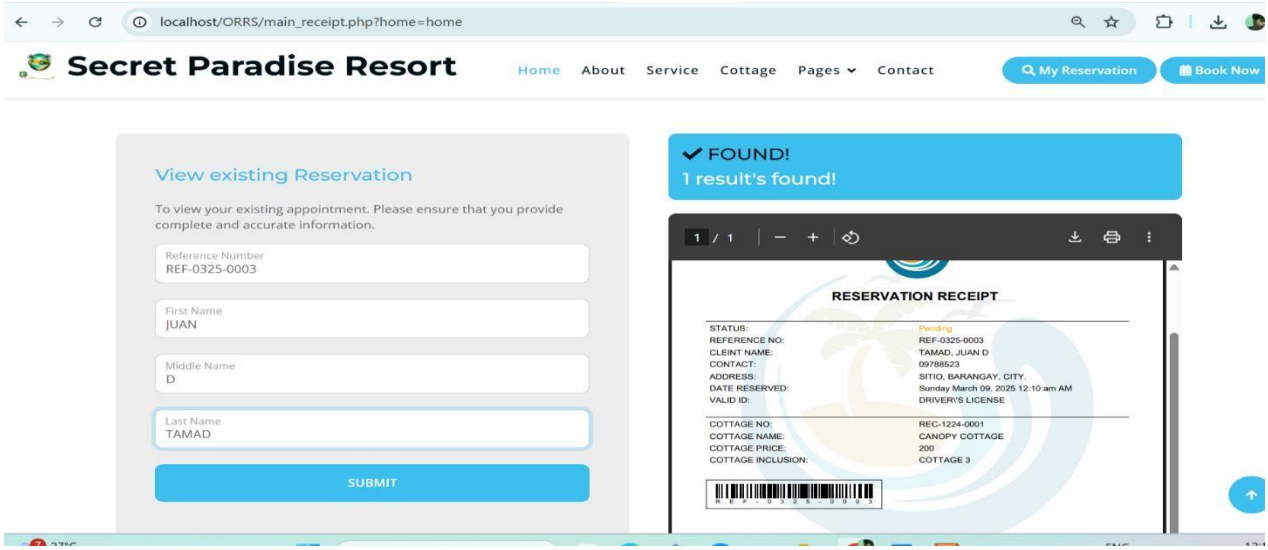

Figure 18. Reservation Receipt

The image shows a Secret Paradise Resort webpage where a user is viewing a pending reservation. The user successfully retrieved a reservation receipt using a reference number, revealing details including the guest's name, contact information, reservation date, cottage details, and the type of ID used.

CHAPTER IV

Conclusion, Recommendation, Bibliography and Appendices

Conclusion

The implementation of the Secret Paradise Resort Reservation System has successfully replaced the resort's outdated manual process with a modern, user-friendly platform. By streamlining reservations and automating payment processing, the system reduces errors and makes the reservation process smooth and hassle-free for guests. It also lessens the administrative workload for resort staff, allowing them to focus on providing better service.

Key features such as real-time availability tracking, secure payment integration, and instant reservation confirmations have greatly improved accessibility and customer satisfaction. These improvements have led to an increase in reservations and positive reviews from guests. The system is also designed to be scalable and secure, ensuring it can support the resort's long-term growth and keep customer data safe.

Despite its success, challenges remain, such as limited internet connectivity in the resort's remote location and the need for staff to adapt to the new system. Ongoing support and training will be essential to address these issues. Overall, this project highlights the importance of digital transformation in improving resort operations, enhancing guest experiences, and strengthening the resort's presence in the tourism industry.

Recommendation

To improve the Secret Paradise Resort Reservation System, several key upgrades should be made. Since the resort is in a remote area, optimizing the system for low-bandwidth connections and ensuring a mobile-friendly design will make reservations more accessible. A simple and user-friendly interface will help guests navigate the system easily, while automating tasks like reservation confirmations and payment tracking will reduce errors and improve efficiency.

Enhancing the reservation experience with useful features will also be beneficial. An AIpowered chatbot can assist guests with inquiries, and allowing guests to customize their reservations with add-ons will provide more flexibility. Strengthening security by expanding

payment options beyond GCash and using encryption will ensure safe transactions and build customer trust. Integrating the system with online travel platforms like Agoda and Reservation.com will also help attract more visitors.

Lastly, using data analytics to track customer preferences and gathering feedback through surveys will help improve the system over time. Understanding reservation trends will allow the resort to enhance its services and marketing. An SEO strategy will also boost online visibility, making it easier for guests to find and reserve their stay. With these upgrades, Secret Paradise Resort can provide a smooth and secure reservation process, improving customer satisfaction and efficiency.

Project Title:	SECRET PARADISE RESORT RESERVATION SYSTEM
Proponents/Researchers:	1. AMADA, JERICO P. 2. CADIZ, SHERWINA S. 3. MALALAY, JANE CAMILLE Z. 4. VILLANUEVA, VINCE SHEM C.
Scope Of the Study:	This project creates an online booking system for Secret Paradise Resort, enabling customers to select and reserve cottages, make secure online payments, and view their reservation status. The system will also provide information about cottages and services, and include a customer feedback feature.
Limitation Of the Study:	The system requires internet access and only allows bookings within the current year. The automatic scheduling system does not allow for manual adjustments or conflict resolution. Furthermore, the down payment is nonrefundable.
Objective Of the Study:	This project will build a reliable online booking system with secure payments, real-time updates, easy access to information, customer feedback tools, automated scheduling, clear policies, and consistent availability.

Subject: Invitation to Serve as Panel Member for Capstone Hearing

Dear Sir,

Greetings!

We, the undersigned students of the Bachelor of Science in Information Technology, respectfully invite you to serve as a panel member for our Capstone Proposal Hearing. Our group consists of four to five members, and we aim to present our proposed project for your review and valuable insights.

The hearing is scheduled as follows:
Date: 12/07/2024
Time: 8:50-9:40 AM
Venue: CAS 5

During the hearing, you will be tasked with evaluating the relevance, feasibility, and technical aspects of our proposed project. Your constructive feedback will greatly help us improve and align our work with academic and industry standards.

We are hoping for your favorable response to this invitation. Thank you very much for considering this invitation. We look forward to the opportunity to learn and improve with your guidance.

Sincerely,

JERICO P. AMADA
